Sedimentary rocks are types of rock that are formed by the accumulation or deposition of small particules and subsequent cementation of mineral or organic particles on the floor of oceans or other bodies of water at the Earth's surface. Sedimentation is the collective name for processes that cause these particles to settle in place. The particles that form a sedimentary rock are called ...

One of the very foundations of evolution and popular science today is the "geologic column." This column is made up of layers of sedimentary rock that supposedly formed over millions and even billions of years.

In geology, depositional environment or sedimentary environment describes the combination of physical, chemical and biological processes associated with the deposition of a particular type of sediment and, therefore, the rock types that will be formed after lithification, if the sediment is preserved in the rock record. In most cases the environments associated with particular rock types or ...

The critical role of rare earth elements (REEs), particularly heavy REEs (HREEs), in high-tech industries has created a surge in demand that is quickly outstripping known global supply and has triggered a worldwide scramble to discover new sources.

The ECSSB belongs to the western part of the East China Sea Basin, which consists of the ECSSB and the Okinawa Trough (Lee et al., 2006). The ECSSB with an area of approximately 240,000 km² is presented covered by seawater depths of 50–200 m. Its maximum deposition thickness is >10,000 m.
